| Office Action Summary | Application No. 09/920,825 | Applicant(s) LEE, JIN WOO | |
| | Examiner Clifford H Knoll | Art Unit 2112 | |

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 21 January 2005.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-24 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-24 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

Te

DETAILED ACTION

This Office Action is responsive to communication filed 1/21/05. Currently claims 1-24 are pending.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

1. *Claims 1-3, 5, 7-24 are rejected under 35 U.S.C. 102(e) as being anticipated by Chan (US 2001/0016920).*

Regarding claim 1, Chan discloses the active module (e.g., Fig. 5A, "244A", "246A") with a primary D-channel that provides a primary FIFO memory for communication of parallel data on a duplexing path (e.g., Fig. 6, "229A", "225A"), a primary C-channel controller (Fig. 5A, "248A") separate from the primary D-channel controller that communicates status information of the active module (e.g., paragraph 51, "local_fail 282A"; Figs. 4, 5A, "282A") and the standby module (e.g., Fig. 5B, "244B", "246B") with a primary D-channel that provides a primary FIFO memory for communication of parallel data on a duplexing path (e.g., Fig. 6, "229B", "225B"), a

Art Unit: 2112

primary C-channel controller (Fig. 5B, "248B") separate from the primary D-channel controller that communicates status information of the active module (e.g., Figs. 4, 5B, "282B"), a C-channel provided between the active and standby modules that exchanges primary and secondary status information (e.g., Fig. 5A, "284A", "EXT_FAIL"), a D-channel, separate from the C-channel, provided between the active and standby module that supports access to primary and secondary memories by both primary and secondary processing units (e.g., Fig. 6, "294A", "294B", "290A", "290B").

Regarding claim 2, Chan also discloses wherein each of the primary and secondary C-channel controllers identifies the primary status information and the secondary status information, based on the values of a self-side active signal, a self-side normal signal, a pair-side active signal, and a pair-side normal signal, and determines which one of the active and standby modules is operating in an active mode and which is operating in a standby mode (e.g., paragraph [0047]).

Regarding claim 3, Chan also discloses the self-side active signal transmitted by the primary C-channel controller is designated as the pair-side active signal, when received by the secondary C-channel controller; the self-side normal signal transmitted by the primary C-channel controller is designated as the pair-side normal signal, when received by the secondary C-channel controller; the self-side active signal transmitted by the secondary C-channel controller is designated as the pair-side active signal, when received by the primary C-channel controller (e.g., paragraph [0047]); and the self-side normal signal transmitted by the secondary C-channel controller is designated as the

Art Unit: 2112

pair-side normal signal, when received by the primary C-channel controller (e.g., paragraph [0050]).

Regarding claim 5, Chan discloses reading a secondary status of a secondary module, via a C-channel, with a primary module, comparing the secondary status with a primary status of the primary module to obtain a first result, determining a direction of a D-channel based upon the value of the first result, and determining which one of the primary and secondary modules is an active module based upon the value of the first result (e.g., paragraph [0047]), reading only the contents of a first memory in the active module to a processor within the active module that requested the contents, when the processor performs a memory read operation of the first memory, and concurrently writing data to the first memory and to a second memory in the one of the primary and secondary modules that is not the active module and is, therefore, designated a standby module, when the processor performs a memory write operation (e.g., paragraph [0040]), and recognizing, with the standby module, that a fault has occurred in the active module by identifying an abnormal signal communicated by a C-channel controller of the active module, changing the active module to a standby mode of operation, changing the standby module to an active mode of operation, changing the primary module or the secondary module that has the active mode of operation to be the active module, and changing the primary module or the secondary module that has the standby mode of operation to be the standby module (e.g., paragraph [0047]).

Regarding claim 7, Chan also discloses wherein step (b) further comprises: analyzing a transfer type signal and an address in a first D-channel controller of the

Art Unit: 2112

active module to obtain a second result; if the second result is determined to be the memory read operation addressed to the first memory, reading the addressed contents only from the first memory and if the second result is determined to be either the memory write operation or the memory read operation addressed to the second memory, writing the address, the transfer type signal, and a transfer size signal from a first FIFO memory of the first D-channel controller to a second FIFO memory of a second D-channel controller of the standby module (e.g., paragraph [0066]); when an empty flag signal is asserted from the second FIFO memory, sending a bus request signal from the second D-channel controller to a bus arbiter of the standby module and receiving a bus grant signal at the second D-channel controller from the bus arbiter; after the bus grant signal is received, generating a transfer start signal from the second D-channel controller to a second memory controller of the standby module and transmitting the address to the second memory via an internal bus operation of the standby module; and if an operation completion signal is generated from the second memory controller, returning the bus grant signal to the bus arbiter (e.g., paragraph [0066], "slave data buffer 229B is not enabled until ...").

Regarding claim 8, Chan also discloses wherein the first FIFO memory writes the address, the transfer type signal and the transfer size signal to the second FIFO memory during the memory read operation (e.g., paragraph [0072], "address and control buffers 231, 233").

Regarding claim 9, Chan also discloses wherein the address determines whether the contents are read from the first memory or the second memory (e.g., paragraph [0072], "262B").

Regarding claim 10, Chan also discloses a first memory address region common to both the first memory and the second memory and a second address region used only for reading from the second memory (e.g., paragraph [0040], "224A has the capability to read from the remote memory 234B").

Regarding claim 11, Chan also discloses wherein the first D-channel controller recognizes both the memory read operation having the second region address and the transfer type signal and converts the second region address into a corresponding first region address and writes the corresponding first region address to the second FIFO memory (e.g., paragraph [0040], "executes the memory write concurrently").

Regarding claim 12, Chan also discloses wherein the first FIFO memory, at the time of the memory write operation, writes the address, the transfer type signal and the transfer size signal to the second FIFO memory and the second D-channel controller transmits the address via an internal bus of the standby module (e.g., paragraph [0040]).

Regarding claim 13, Chan also discloses if the memory read operation or the memory write operation is completed abnormally, the second D-channel controller inputs a transfer error acknowledge signal and asserts a D-channel error signal to the first D-channel controller, thereby generating a D-channel interrupt signal to the active module (e.g., paragraph [0051]).

Regarding claim 14, Chan also discloses if the memory read operation from the second memory is completed normally, the first D-channel controller communicates a primary transfer completion message to a first memory controller of the active module and the second D-channel controller communicates a secondary transfer completion message to the second memory controller (e.g., paragraph [0074]).

Regarding claim 15, Chan also discloses if the memory write operation to the second memory is completed normally, the second D-channel controller informs the first D-channel controller of a write completion (e.g., paragraph [0074]).

Regarding claim 16, Chan also discloses where step (c) further comprises: generating an interrupt in the active module, if the fault occurs; if the interrupt is generated in the active module, writing register information of a first D-channel controller, during a delay time, to a second FIFO memory of a second D-channel controller in a burst mode; if the write operation in the burst mode is completed, asserting a self-side abnormal status and a first self-side active status of the C-channel controller of the active module to a high state and transmitting an assert signal to the second D-channel controller; and asserting a second self-side active signal of the standby module to a low state; and changing the standby module to the active mode of operation (e.g., paragraph [0077]).

Regarding claim 17, Chan discloses a first device and a second device of the duplex device each having a D-channel controller and a C-channel controller; a D-channel interconnecting the D-channel controllers of the first and second devices (e.g., Figure 4), to convey at least one of data signals, address signals, and control signals

Art Unit: 2112

(e.g., Figure 6, "229A"); and a C-channel interconnecting the C-channel controllers of the first and second devices to convey status signals, wherein the C-channel controller of the first and second devices each monitor a subset of the C-channel status signals to determine which of the first and second devices has an active mode status and which has a standby mode status, and both the active mode status and the standby mode status are identified by a self-side normal signal and a pair-side active signal (e.g., paragraph [0047]).

Regarding claim 18, Chan also discloses the active mode status is identified by a true state existing on the self-side normal signal and a false state existing on the pair-side active signal, and the standby mode status is identified by other combinations of the true and false states existing on the self-side normal and pair-side active signals (e.g., paragraph [0047]).

Regarding claim 19, Chan also discloses whichever one of the first and second devices that has the active mode status, generates the address signals conveyed by the D-channel (e.g., paragraph [0044]).

Regarding claim 20, Chan also discloses each of the first and second devices share a common address bus and a common data bus and further comprises: a communication processor that communicates input and output I/O) information between the duplex device and external devices; a central processing unit that controls communication processes within the respective first and second devices; a memory that stores retained information; an arbiter that arbitrates the use of the common data bus, wherein one of the first and second devices has the active mode status to generate

Art Unit: 2112

the address signals conveyed by the D-channel and to control a read access and a write access to each memory of the first and second devices (e.g., Figure 6, paragraph [0033]).

Regarding claim 21, Chan also discloses within both of the first and second devices, respectively, the communication processor, the central processing unit, the memory, and the D-channel controller share the common data bus and the common address bus (Figure 6).

Regarding claim 22, Chan also discloses reading a first status of the first device and a second status of the second device; setting one of the first and second devices to an active mode status and the other of the respective devices to a standby mode status based on the first and second status, wherein both the first status and the second status are identified by a self-side normal signal and a pair-side active signal (e.g., paragraph [0047]).

Regarding claim 23, Chan also discloses the active mode status is identified by a true state existing on the self-side normal signal and a false state existing on the pair-side active signal, and the standby mode status is identified by other combinations of the true and false states existing on the self-side normal and pair-side active signals (e.g., paragraph [0047]).

Regarding claim 24, Chan also discloses the first and second devices each have a communication processing unit, a central processor, a memory, and a D-channel controller, which share both a common address bus and a common data bus; the first and second devices each have a C-channel controller that communicates with the

Art Unit: 2112

central processor of the respective first and second devices; a D-channel interconnects the D-channel controllers of the first and second devices to convey data signals, address signals, and control signals; and a C-channel interconnects the C-channel controllers of the first and second devices to convey the first and second status between the first and second C-channel controllers, wherein one of the first and second devices has the active mode status to generate the address signals conveyed by the D-channel and to control a read access and a write access to the memories of both the first and second devices (e.g., Figure 4).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. *Claims 4 and 6 stand rejected under 35 U.S.C. 103(a) as being unpatentable over Chan as applied to claims 3 and 5, respectively, above, and further in view of standard bus master embodiment, as further evidenced by of Shaffer (US 5884051).*

Regarding claim 4, Chan also discloses wherein each of the primary and secondary D-channel controllers obtains the primary status information and secondary status information, from the primary or secondary C-channel controller of its respective

Art Unit: 2112

one of the active or standby modules and executes a duplexing operation, as a master or slave in a communication direction of the D-channel determined by a comparison of the primary status information and the secondary status information (e.g., paragraph [0045]). While Chan does not expressly mention a particular embodiment of the power PC (PPC) bus, the Examiner takes Official Notice that this is a well-known bus master standard as further evidenced by Shaffer. Shaffer discloses the well-known power PC bus (e.g., col. 4, lines 51-55, Figure 1). It would be obvious to combine the power PC bus with Chan, because the power PC bus is well-known bus master standard, and well recognized alternative embodiment of such. Therefore it would be obvious to one of ordinary skill in the art to combine a particular bus standard with Chan at the time the invention was made to obtain the claimed invention.

Regarding claim 6, Chan also discloses wherein the active module executes the memory write operation to the second memory, via the D-channel, and each of a primary D-channel controller and a secondary D-channel controller executes a duplexing operation (e.g., paragraph [0040]). While Chan does not expressly mention a particular embodiment of the power PC (PPC) bus, the Examiner takes Official Notice that this is a well-known bus master standard as further evidenced by Shaffer. Shaffer discloses the well-known power PC bus (e.g., col. 4, lines 51-55, Figure 1). It would be obvious to combine the power PC bus with Chan, because the power PC bus is well-known bus master standard, and well recognized alternative embodiment of such. Therefore it would be obvious to one of ordinary skill in the art to combine a particular

Art Unit: 2112

bus standard with Chan at the time the invention was made to obtain the claimed invention.

Response to Arguments

Applicant's arguments filed 1/21/05 have been fully considered but they are not persuasive.

Regarding claim 1, Applicant argues that Chan does not disclose the controllers as being separate, pointing to Chan's disclosure of a single memory controller (p. 17); however, Examiner relies on the memory control logic unit (Fig. 5A, "244A") in the current rejection, and finds it to be separate from the reset and fail logic unit (Fig. 5A, "248A"). Any further criterion for separateness that might distinguish from this interpretation is not supported in the claims.

Applicant further argues that Chan's memory controller would operate differently than the present application's use of the D-controller and C-controller (pp. 17-18); however, the distinction cannot be seen in the invention as it is claimed. Examiner finds all features claimed (e.g., "communication of parallel data on a duplexing path", "communicates primary status information") to be anticipated by Chan.

Regarding claim 5, Applicant argues that Chan does not disclose "reading a secondary status of a secondary module, via the C-channel..." (p. 18); however, as treated supra, this secondary status is anticipated by Chan (e.g., Fig. 5A, "282A").

Regarding claim 22, Applicant argues that Chan does not disclose "reading a first status of the first device transmitted over the C-channel and a second status of the

Art Unit: 2112

second device transmitted over the C-channel, and setting one of the first and second devices to an active mode status and the other of the respective devices to a standby mode status..." (p. 18); however, as shown supra, Chan discloses all of these features.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Clifford H Knoll whose telephone number is 571-272-3636. The examiner can normally be reached on M-F 0630-1500.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mark H Rinehart can be reached on 571-272-3632. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
